Copper Chelators For PET imaging

Clarity has proprietary chelators for use in PET imaging. Our chelators are designed for copper-64, an isotope with a half life of 12.7 hours. Copper-64 is therefore ideally suited to those longer lived biological molecules that accumulate over time such as antibodies, antibody fragments, proteins and peptides.

We offer our chelators and imaging services to external parties who require PET imaging and can cater to all your needs. Clarity has access to world-class infrastructure and researchers in the field of nuclear medicine. Our niche is the field of theranostics and companion diagnostics.

Products

Bifunctional chelators

Services

Conjugation and in vivo animal
